DATA CLEANING

Used data cleaning tecniques in accordance to cleaning process

• REMOVING UNNECESSARY COLUMNS:

COLUMNS LIKE 'UNNAMED: 11', 'HREF', 'CASE NUMBER.1', 'UNNAMED: 21', 'UNNAMED: 22', AND 'ORIGINAL ORDER' WERE DROPPED AS THEY WERE EITHER UNNAMED, CONTAINED URLS, OR LACKED INFORMATIVE DATA.

• RENAMING COLUMNS:

EMPTY OR UNCLEAR COLUMN NAMES WERE REPLACED WITH MORE DESCRIPTIVE NAMES

- RENAMING VALUES AND CLEANING TYPOS
- DROPPING NULL VALUES:

ROWS WITH NULL VALUES WERE DROPPED FROM THE DATAFRAME USING THE DROPNA() FUNCTION.

• ADJUSTING DATA TYPES:

DATA WRANGLING AND CLEANING CROSSSING BUGGE

• Processing huge dataframe.

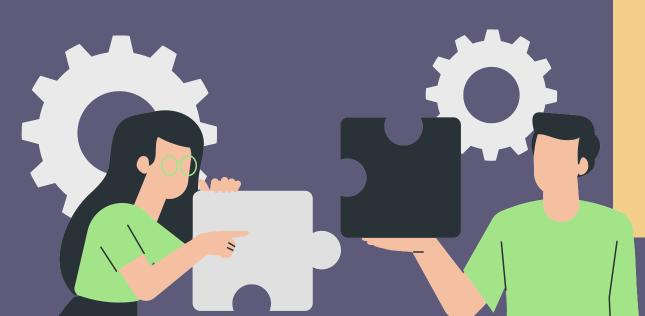

Handling of missing and misspelled data.

Mostly solved by going through unique values and renaming it acordingly.

Inconsistent data formats and entries.

Columns like State/Country/Location were sharing same entries, mixed with a lot of desriptions rather than entries in columns like "Name", "Activity", "Injury"

Transparency Issues

PROJECT OVERVIEW

Problem statement: Shark attack reports are increasing over the past years

Hypothesis: An escalation in oceanic activities, such as surfing and swimming, will correlate with an increase in shark attacks in the USA.

EXPLORATORY DATA ANALYSIS

Used Methods:

- Exploring relationships between variables.
- Performing Hypothesis testing
- Visualising data distibutions

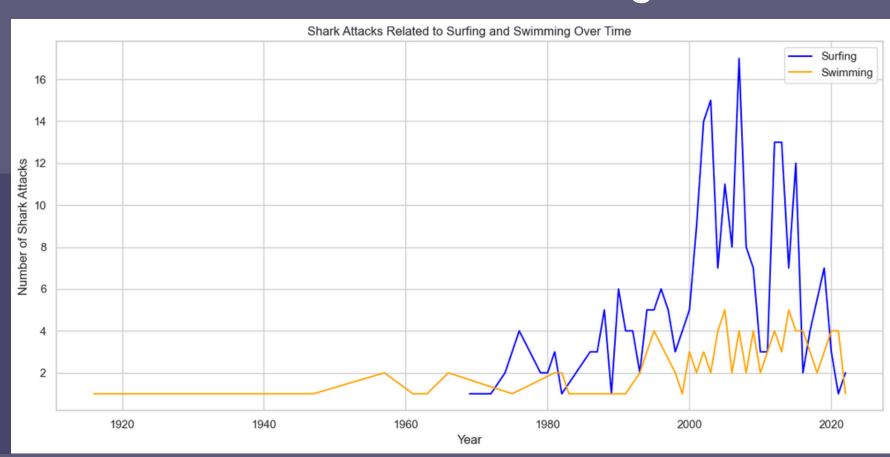

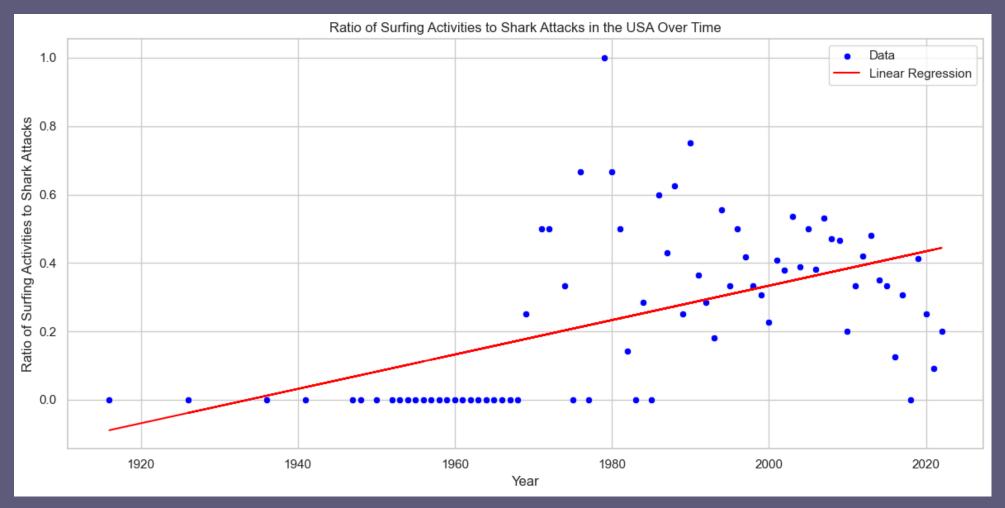

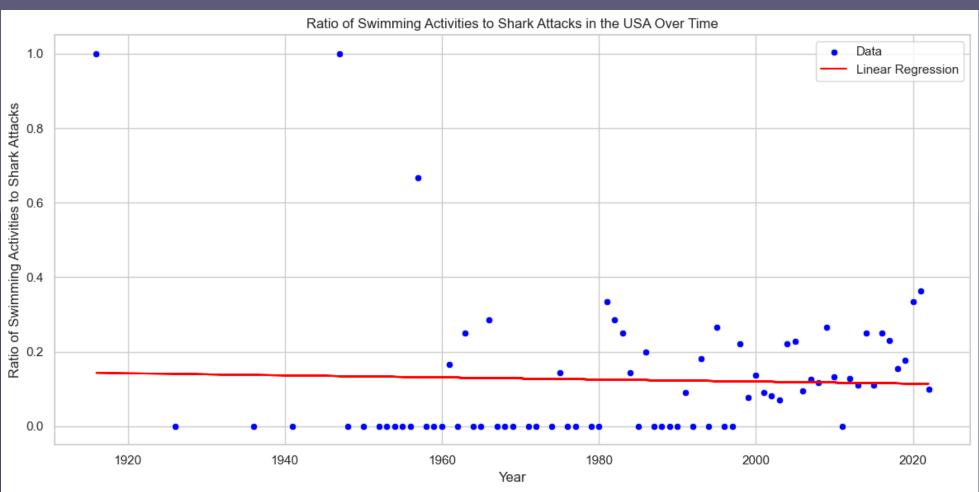

CONCLUSION:

Problem statement: Increase in shark attack reports in recent years.

Hypothesis was partially accepted as shark attack increase in USA, but only show a moderate correlation to surfing and not other activities such swimming.

MAJOR OBSTACLE

01

02

03

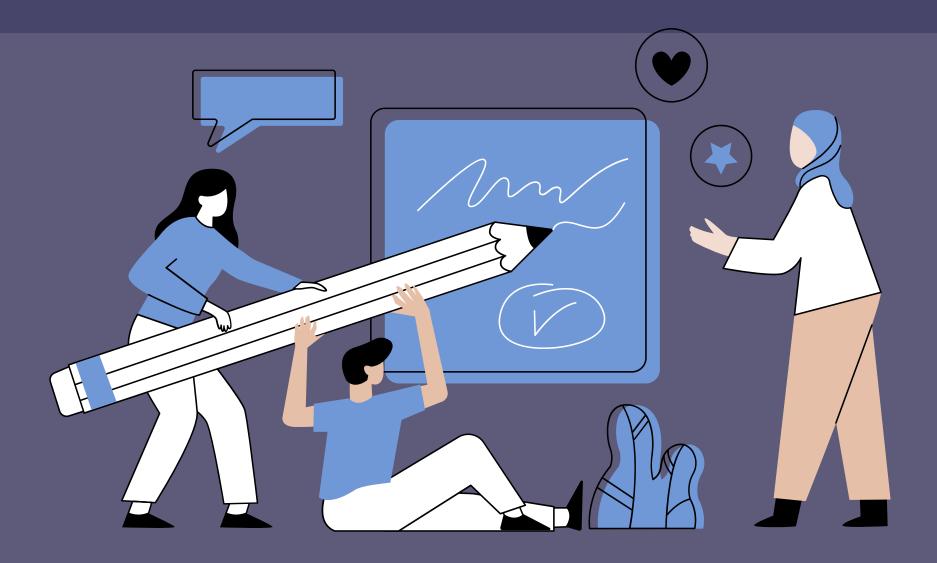

- Limited time exploring extra features and improvements.
- Very little to no experience with cleaning stressed out our decision making process.
- Comparing to a day 1 we gained a lot of insightful experience that would have allowed us to make some things in more efficient manner.
